Entities

Shop (shopName)

Product (PID, productName, maker, category, quantity, averageRating, userCount, currentPrice)

PriceRecord (startDate, endDate, price)

Employee (EID, name, monthlySalary)

Complaint (CID, text, complaintStatus, complaintDate, resolveDate, pickUpDate)

ShopComplaint

ProductComplaint

OrderLine (deliveryDate, orderLineStatus, orderItemPrice, orderItemQuantity, OLID)

Order (OID, shippingAddress, timestamp, shippingCost)

User (UID, name)

Relationships

- Shop — sells — Product
- Product — has — PriceRecord
- Employee — handles — Complaint
- Product — about — ProductComplaint
- Shop — about — ShopComplaint
- ShopComplaint — isa — Complaint
- ProductComplaint — isa — Complaint
- Complaint — makes — User
- Product — in — OrderLine
- OrderLine — review (dateModified, comment, rating) — User
- OrderLine — contains — Order
- User — places — Order

- **Shop** is an entity set, with *shopName* as the key. Each record in **Shop** represents a shop selling products on the Shiokee website.
- **Product** is a weak entity set in a supporting relationship "sells" with **Shop**. We opted to make **Product** a weak entity set as each record in **Product** represents a specific listing of an item sold by a specific **Shop**, and requires **Shop** to be uniquely identifiable and part of the composite key for **Product.** **Product** has *shopName, PID* and *shopName, productName* as keys.
  - Assumption: Each **Shop** does not sell two products with the same *productName*.
- **PriceRecord** is a weak entity set in a supporting relationship "has" with **Product**. Each record in **PriceRecord** represents the price of a **Product** over a specific period of time, and requires **Product** to be uniquely identifiable and part of the composite key for **PriceRecord**. **PriceRecord** has *shopName, productName, startDate* and *shopName, PID, startDate* as keys.
- **Order** is an entity set with *OID* as the key. Each record in **Order** represents an order that was placed by a user, consisting of products from shop(s) (**OrderLine**) on the Shiokee website.
- **User** is an entity set with *UID* as the key. Each record in **User** represents a user on the Shiokee Website.
- **Order** and **User** have a many-to-one 'places' relationship with referential integrity on the **User** side as a **User** can place multiple **Orders** while an **Order** must be placed by a **User**.
- **OrderLine** is a weak entity set in supporting relationships "contains" with **Product** and "in" with **Order**. Each record in **OrderLine** represents the **Product** purchased by the user in an **Order**, and requires **Product** and **Order** to be uniquely identifiable. **OrderLine** has *shopName, productName, OID* as a key.
- **OrderLine** and **User** have a many-to-one 'review' relationship as one **User** can review multiple **Products** while an **OrderLine** can be reviewed by only one **User** that placed the **Order**.
- **Complaint** is an entity set with *CID* as the key. Each record in **Complaint** represents a complaint made by a user on the Shiokee website.
  - It has two subclasses, **ShopComplaint** and **OrderLineComplaint** that each represent a complaint about a **Shop** and **OrderLine** respectively.
- **Complaint** and **User** have a many-to-one 'makes' relationship with referential integrity on the **User** side as a **User** can make multiple **Complaints** while a **Complaint** must be made by a **User**.
- **Employee** is an entity set with *EID* as the key. Each **Employee** represents an individual working for Shiokee.
- **Complaint** and **Employee** have a many-to-one 'handles' relationship as an **Employee** can handle multiple **Complaints** while a **Complaint** will be handled by only one **Employee**.
  - There is no referential integrity as a **Complaint** does not necessarily have to be immediately handled by an **Employee** until one is assigned to the **Complaint**, as stated in Appendix A.

OrderLine(<u>OID</u>, <u>OLID</u>, shopName, productName, orderItemQuantity, orderItemPrice, orderLineStatus, deliveryDate, UID, dateModified, rating, comment**)**

Let:

<u>OID: A</u>

<u>OLID: B</u>

shopName: C

productName: D

orderItemQuantity: E

orderItemPrice: F

orderLineStatus: G

deliveryDate: H

UID: I

dateModified: J

rating: K

comment: L

OrderLine(<u>A</u>, <u>B</u>, C, D, E, F, G, H, I, J, K, L)

Keys: AB

Primary Key: AB

FDs:

AB → CDEFGHIJKL

A → I

Table is not in 3NF as A → I violates 3NF. LHS of the FD does not contain a key of Product, while RHS of the FD are not key attributes of product as the only key is AB. 3NF decomposition is to be performed.

1. Finding Minimal Basis, with S representing set of FDs:
    a. Split the FDs such that RHS contains only one attribute, S={A → I, AB → C, AB → D, AB → E, AB → F, AB → G, AB → H, AB → I, AB → J, AB → K, AB → L }
    b. Remove redundant FDs:
        i. AB → I: After removal. {AB}$^+$={ABCDEFGHIJKL}, I in closure, FD is redundant.

Remaining FDs are non-redundant as removal of these FDs result in RHS of FDs no longer being in the closure of the LHS of the FDs.

Remaining S={A → I, AB → C, AB → D, AB → E, AB → F, AB → G, AB → H, AB → J, AB → K, AB → L}

   c. Remove redundant attributes: No attributes are redundant on LHS

2. Combining FDs with same LHS

      S={AB → CDEFGHJKL, A → I}

3. For each FD, create a table that contains all attributes in FD:

      R1(A, B, C, D, E, F, G, H, J, K, L), R2(A, I)

4. Remove any redundant tables.

   a. There are no redundant tables

5. If no table contains a key of the original table, add a table that contains a key of the original table

   a. Key AB is in R1, so there is no need to create any new relation.

Decomposed Relations: R1(A, B, C, D, E, F, G, H, J, K, L), R2(A, I)

Employee(EID, name, monthlySalary)
Key: EID
Primary Key: EID
FDs: EID → name, monthlySalary
The relation is in 3NF since the LHS of the above FD contains a key.

Shop(shopName**)**
Key: shopName
Primary Key: shopName
The relation is in 3NF since there is only one trivial FD.

PriceRecord(shopName, productName, startDate, endDate, price)
Keys: (shopName, productName, startDate), (shopName, productName, endDate)
Primary Key: (shopName, productName, startDate)
FDs:
shopName, productName, startDate → endDate, price
shopName, productName, endDate → startDate, price
The relation is in 3NF since the LHS of the above FDs contain keys.

Product(shopName, productName, PID, maker, category, quantity, averageRating, userCount, currentPrice)

Let:

shopName: A

productName: B

PID: C

maker : D

category: E

quantity: F

averageRating: G

userCount: H

currentPrice: I

Product(A, B, C, D, E, F, G, H, I)

Keys: AB, AC

Primary Key: AB

FDs:

B→ DE

AC → BDEFGHI

AB → CDEFGHI

Table is not in 3NF as B → DE violates 3NF. LHS of the FD does not contain a key of Product, while RHS of the FD are not key attributes of product as the only keys are AB and AC. 3NF decomposition is to be performed.

1. Finding Minimal Basis, with S representing set of FDs:
    a. Split the FDs such that RHS contains only one attribute, S = {B → D, B → E, AC → B, AC → D, AC → E, AC → F, AC → G, AC → H, AC → I, AB → C, AB → D, AB → E, AB → F, AB → G, AB → H, AB → I}
    b. Remove redundant FDs:
        i. AC → D: After removal. {AC}⁺={ABCDEFGHI}, D in closure, FD is redundant.
        ii. AC → E: After removal. {AC}⁺={ABCDEFGHI}, E in closure, FD is redundant.
        iii. AC → F: After removal. {AC}⁺={ABCDEFGHI}, F in closure, FD is redundant.

      iv.   AC → G: After removal. $\{AC\}^+=\{ABCDEFGHI\}$, G in closure, FD is redundant.

      v.   AC → H: After removal. $\{AC\}^+=\{ABCDEFGHI\}$, H in closure, FD is redundant.

      vi.   AC → I: After removal. $\{AC\}^+=\{ABCDEFGHI\}$, I in closure, FD is redundant.

      vii.   AB → D: After removal. $\{AB\}^+=\{ABCDEFGHI\}$, D in closure, FD is redundant.

      viii.   AB → E: After removal. $\{AB\}^+=\{ABCDEFGHI\}$, E in closure, FD is redundant.

Remaining FDs are non-redundant as removal of these FDs result in RHS of FDs no longer being in the closure of the LHS of the FDs.

S = {B → D, B → E, AC → B, AB → C, AB → F, AB → G, AB → H, AB → I}

  c. Remove redundant attributes: No attributes are redundant on LHS

        $\{A\}^+=\{A\}$

        $\{B\}^+=\{BDE\}$

        $\{C\}^+=\{C\}$

If we remove an attribute from the LHS, then the resulting FD is a new FD that cannot be derived from the original set of FDs.

S = {B → D, B → E, AC → B, AB → C, AB → F, AB → G, AB → H, AB → I}

2. Combining FDs with the same LHS.

        S = {B → DE, AC → B, AB → CFGHI}

3. For each FD, create a table that contains all attributes in FD.

        R1(B, D, E), R2(A, B, C), R3(A, B, C, F, G, H, I)

4. Remove any redundant tables.

  a. Remove redundant table R2 as A, B, C are in R3.

5. If no relation contains a key of the original table, create a new relation containing the key of the original relation

  a. Key AB is in R3, so there is no need to create any new relation.

Decomposed Relations: R1(B, D, E), R3(A, B, C, F, G, H, I)

Order(OID, shippingAddress, timestamp, shippingCost, UID)

Let:

OID: A

shippingAddress: B

timestamp: C

shippingCost: D

UID: E

Order(A, B, C, D, E)

Key: A

Primary Key: A

FDs: A→BCDE, BC→D

BC→D is not in 3NF as the LHS of the FD does not contain a key of Order and the attribute on the RHS of the FD is not contained in a key of Order either. Hence, there is a need to perform 3NF decomposition on the FDs.

1. Finding minimal basis S of set of FDs:
    a. Splitting FDs such that RHS only contain 1 attribute
       S = {A→B, A→C, A→D, A→E, BC→D}
    b. Removing redundant FDs
       i. Removing A→D, {A}$^+$ = {ABCED}. D is in closure of A, hence A→D is redundant.
       Remaining FDs are non-redundant as removal of these FDs result in RHS of FDs no longer being in the closure of the LHS of the FDs.
       S = {A→B, A→C, A→E, BC→D}
    c. Removing redundant attributes in LHS of FDs:
       i. Removing B from BC→D, {C}$^+$ = {C}. D not in closure of C. B is not redundant.
       ii. Removing C from BC→D, {B}$^+$ = {B}. D not in closure of B. C is not redundant.
       S = {A→B, A→C, A→E, BC→D}
2. Combine FDs with same LHS in minimal basis S
       S = {A→BCE, BC→D}
3. For each FD in minimal basis S, create a new relation.
       R1(A, B, C, E), R2 (B, C, D)
4. Remove any redundant tables.

a. There are no redundant tables
5. If no relation contains a key of the original table, create a new relation containing the key of the original relation.
   a. Key A is in R1, so there is no need to create any new relation.

Decomposed 3NF relations: R1(A, B, C, E), R2 (B, C, D)

User (<u>UID</u>, Name**)**
Key: UID
Primary Key: UID
FDs: UID → Name
The relation is in 3NF since the LHS of the above FD contains a key

ER approach of handling subclasses, a record can appear in multiple relations
Complaint(<u>CID</u>, text, complaintStatus, complaintDate, resolveDate, pickUpDate)
Let:
<u>CID: A</u>
text: B
complaintStatus: C
complaintDate: D
resolveDate: E
pickUpDate: F

Complaint(<u>A</u>, B, C, D, E, F)
Key: A
Primary Key: A
FDs: A → BCDEF
The relation is in 3NF since the LHS of the above FD contains a key.

ShopComplaint(<u>CID</u>, shopName)
Key: CID
Primary Key: CID
FD: CID → shopName

ProductComplaint(<u>CID</u>, productName)

Key: CID

Primary Key: CID

FD: CID → productName
